LTE-Advanced, the next evolutionary step, added significant improvements, such as carrier aggregation, to further enhance delivery of mobile broadband services. LTE-Advanced Pro builds the basis for 5G, the next major step in wireless communications – for example with the introduction of NB-IoT for massive machine type communications (mMTC).

The fifth generation of telecommunications technologies, 5G, is fundamental to achieving a European gigabit society by 2025. The aim to cover all urban areas, railways and major roads with uninterrupted fifth generation wireless communication can only be achieved by creating a very dense network of antennas and transmitters.

that began wide deployment in 2019. As with previous standards, the covered areas are divided into regions called "cells", serviced by individual antennas. Virtually every major telecommunication service provider in the developed world is deploying antennas or intends to deploy them soon. The frequency spectrum of 5G is divided into millimeter waves, mid-band and low-band. Low-band uses a similar frequency range as the
