heater to furnish heat to the space of a residence, as well as its domestic hot water. A simple recirculating loop of hot water is tapped off near the top of the heater and is circulated through a finned tube heat exchanger in an air handler or duct coil that furnishes warmed air to the space. The cooled water (140°

Water temperature: Apollo hydro heat systems were designed to be fed by 140°F water in order to function at max efficiency, and shortest run time. 140°F is much too hot for the water fixtures in your home and would be a dangerous scalding hazard. Therefore, the original installers, should have installed mixing

Rather than just holding hot water until someone needs it, Apollo Hydroheating Systems use the hot water in their tanks to heat the air surrounding the tank.

These systems have a mixing valve which mixes 140 degree water from the system's tank with cold water to bring the water temperature down to 120 degrees before it reaches the hot water
