With transposition you can convert a row vector to a column vector and vice versa: Vector transposition. The transpose \mathbf{A}^T of the matrix \mathbf{A} corresponds to the mirrored axes. If the matrix is a square matrix (same number of columns and rows): Square matrix transposition. If the matrix is not square the idea is the same:

If you are going to search for materials for vector analysis(not including Dirac delta function. This is a somewhat more complex concept), you can refer to Fleming's book Functions of Several Variables. And for references for Dirac delta function, I recommend Grubb's book Distributions and Operators(Graduate Texts in Mathematics, vol. 252).

In physics, when you have a vector, you have to keep in mind two quantities: its direction and its magnitude. Quantities that have only a magnitude are called scalars. If you give a scalar magnitude a direction, you create a vector. Visually, you see vectors drawn as arrows, which is perfect because an arrow has [...]
