BRE Digest 251, and in particular the categorisation above, is now used widely in the industry as a way of classifying cracks and determining whether any intervention is necessary. It should be stressed that these comments are a simplification of the assessment needed to properly classify damage to housing.

• BRE DIGEST 412 gives a methodology for calculating the potential heave. • This is carried out from moisture contents taken at regular intervals from the boreholes. One borehole should be close to the effected structure, the other in a green field location, ie away from trees where the moisture content should be at its equilibrium.

The BRE Digest 365 soakage test is carried out in trial pits filled with gravel to ensure the sides of the trial pit remain stable during charging and draining. The infiltration rate is determined by filling the pit with water and determining the length of time for a proportion of the volume of water to drain away.
