Breeding Behavior and Parental Care of the Induced Bred ...

Once male parental care is present, it is thought that if predation pressures become sufficient that the male alone cannot successfully raise the brood, then biparental care will evolve. There are some noteworthy examples of biparental care in diverse groups of fishes.

own offspring. It is a complex social behaviour in vertebrates associated with animal mating systems, life history traits, and ecology. Paternal care may be provided in concert with the mother or, more rarely, by the male alone. The provision of care, by either males or females, is presumed to increase growth rates, quality, and/or survival of young,

The nesting age had the greatest effect on parental care; As the nestlings grew older, feeding rate increased, time left unattended increased, and time spent brooding nestlings decreased. Brooding is where the adult birds place a featherless patch of skin on the eggs to increase heat transfer during incubation.
