Caesar cipher (or Caesar code) is a shift cipher, one of the most easy and most famous encryption systems. It uses the substitution of a letter by another one further in the alphabet.

In cryptography, a Caesar cipher, also known as Caesar's cipher, the shift cipher, Caesar's code or Caesar shift, is one of the simplest and most widely known encryption techniques. It is a type of substitution cipher in which each letter in the plaintext is replaced by a letter some fixed number of positions down the alphabet. For example, with a left shift of 3, D would be replaced by A, E would become B, and so on. The method is named after Julius Caesar, who used it in his private correspond

The Caesar cipher, also known as a shift cipher, Caesar's code, or Caesar shift is one of the oldest and most famous ciphers in history. While being deceptively simple, it has been used historically for important secrets and is still popular among puzzlers. Are you unsure that your cipher is a Caesar cipher?

The Caesar Box code is a cipher in which each letter is replaced with another letter that's a fixed number of positions down the alphabet. To decode one, start by counting the number of characters in the code. Then, determine the square root of that number. For example, if there are 16 characters in the code, the square root of 16 is 4.

The Caesar Cipher technique is one of the earliest and simplest method of encryption technique. It's simply a type of substitution cipher, i.e., each letter of a given text is replaced by a letter some fixed number of positions down the alphabet. For example with a shift of 1, A would be replaced by B, B would become C, and so on.

ROT13 ("rotate by 13 places", sometimes hyphenated ROT-13) is a simple letter substitution cipher that replaces a letter with the 13th letter after it in the alphabet. ROT13 is a special case of the Caesar cipher which was developed in ancient Rome.. Because there are 26 letters (2×13) in the basic Latin alphabet, ROT13 is its own inverse; that is, to undo ROT13, the same algorithm is applied ...

Caesar cipher decryption tool. The following tool allows you to encrypt a text with a simple offset algorithm - also known as Caesar cipher. If you are using 13 as the key, the result is similar to an rot13 encryption. If you use "guess" as the key, the algorithm tries to find the right key and decrypts the string by guessing. I also wrote a small article (with source) on how to crack caesar-cipher in an unknown context of an encrypted text.

The Caesar cipher is one of the earliest known and simplest ciphers. It is a type of substitution cipher in which each letter in the plaintext is 'shifted' a certain number of places down the alphabet. For example, with a shift of 1, A would be replaced by B, B would become C, and so on.

The Shift (or Caesar) Cipher is another monoalphabetic substitution cipher. Although more secure than the Atbash Cipher, it is still an easy cipher to break, especially by today's standards. Originally, it was used by Julius Caesar for sending encrypted messages to his troops, as recorded by Suetonius:

The Caesar cipher is very simple to break, once you have deciphered one letter the rest are automatically known. You could make the cipher more difficult to break by scrambling the order of letters on one wheel.

The keyed Caesar cipher is a variant of the Caesar Cipher that provides increased protection. Instead of having all letters in alphabetical order, it starts with a code word (the encryption key). Unused letters are then added after the code word. If the code word is blank, it behaves exactly like an ordinary Caesar Cipher.

Caesar cipher is a basic letters substitution algorithm. It takes as input a message, and apply to every letter a particular shift. This shift used to be 3, according to history, when it was use by Caesar to encrypt war messages (so for example a would become d, b will be e, and so on and so forth). Of course you can choose any shift you want.
