**PATHOLOGY OF OVARIAN TUMORS** Most tumors of the ovary can be placed into one of three major categories— surface epithelial-stromal tumors, sex cord-stromal tumors, and germ cell tumors (Fig. 1)—according to the anatomic structures from which the tumors presumably originate. Each category includes a number of subtypes.

Ovarian germ cell tumors (OGCTs) are derived from primordial germ cells of the ovary (figure 1). They may be benign or malignant. These neoplasms comprise approximately 20 to 25 percent of ovarian neoplasms overall, but account for only an approximate 5 percent of all malignant ovarian neoplasms [ 1-3 ].

preoperative diagnostic workup of an ovarian mass is typically limited to imaging studies and serum markers, both of which suffer from low sensitivity and specificity. Therefore, intraoperative frozen section evaluation is crucial for determining the required extent of surgery, that is, cystectomy for benign

## **Frozen Section Diagnosis of Ovarian Epithelial Tumors ...**

Cancer is on the outer surface of at least one of the ovaries or fallopian tubes or the capsule (tissue surrounding the tumor) has ruptured (burst) before surgery (which could allow cancer cells to spill into the abdomen and pelvis). This is stage IC2. Cancer cells are found in the fluid (ascites) or washings from the abdomen and pelvis.
