Basic 4 Stroke/Cycle Engine Operation. The spent mixture (exhaust) is discharged. This cycle requires 2 crankshaft revolutions to complete. The camshaft, which is operating the valves, will only complete one revolution during this cycle. Therefore, the cam drive is a 2:1 ratio with the crankshaft (2

Engine Lubrication System: When two metallic surfaces under direct contact move over each other, they create friction which generates heat. This causes excessive wear and tear of those moving parts.

However, when a film of lubricating matter separates them from each other, they do not come in physical contact with each other.
