This system is very similar to an automotive cooling system. It consists of two radiators, located in the motorcycle's right and left side lower fairings. It has fans, a thermostat, expansion tank, pressure cap, a pump and input/output hoses. The cooling system pumps coolant around the motor's exhaust valves, helping the engine to run cooler or not overheat.

When Harley launched the 2014 model range this week they introduced a new Twin-Cooled 103 and 110 engine to the range. By Twin-Cooled they mean that water and coolant is used to cool the heads near the exhaust ports where most of the heat is generated. It seems this has largely been done for rider comfort and to pass tough new emissions laws.
