I am reading the book by Lee - Introduction to topological Manifolds and I like it a lot how it explains the things. I was reading the book by Isidori (Nonlinear Control Systems) and here there is more focus on the explanation of what is a manifold, Riemannian manifold etc. The books are totally different.

We prove some uniqueness result for solutions to the heat equation on Riemannian manifolds. In particular, we prove the uniqueness of L^p solutions with $0 < p < 1$ and improves the L^1 uniqueness result of Li (J Differ Geom 20:447-457, 1984) by weakening the curvature assumption.

The book assumes working knowledge of smooth manifolds and Lie brackets, while many students need review of the former, and know nothing of the latter. Lee doesn't give enough examples beyond constant curvature spaces: there is virtually no mention of warped products, Riemannian submersions, Lie groups, or homogeneous spaces.

manifolds. These are compact manifolds with boundary X^- equipped with a Riemannian metric g on $X = X^-$, such that $\hat{g} = x^2g$ extends to be a C^∞ positive-definite symmetric-cotensor up to ∂X (so \hat{g} is a Riemannian metric on X^-), where x is a defining function of ∂X , and such that $|dx|_{\hat{G}} = 1$; here \hat{G} is the dual metric of g .

The book also contains material on the general theory of connections on vector bundles and an in-depth chapter on semi-Riemannian geometry that covers basic material about Riemannian manifolds and Lorentz manifolds. An unusual feature of the book is the inclusion of an early chapter on the differential geometry of hypersurfaces in Euclidean space.
