This chapter extends the basic concepts of multirate signal processing to multidimensional multirate signal processing. Examples of multidimensional signals include images in two dimensions and video in three dimensions. Good reference texts for background material on multidimensional signal processing are Dudgeon and Mersereau[16] and Lim[26].

However, in many applications such as audio, medical or radar signal processing, signals to be analyzed are of large sizes or received in real-time, time-frequency representations of such a signal cannot be calculated using the entire signal. The common approach is to calculate the spectrum segment-by-segment.

Multirate Signal Processing - Discrete Time Signal Processing

Strictly speaking, "multirate" means you are processing or sampling the signals at different rates in the same system. Usually the rates are multiples of one another. Allan Steinhardt mentioned one kind of multirate processing, which is decimation or down-sampling, and corresponds to lowering the processing rate.

What is multirate digital signal processing? - Quora

Digital signal processing (DSP) is the use of digital processing, such as by computers or more specialized digital signal processors, to perform a wide variety of signal processing operations. The digital signals processed in this manner are a sequence of numbers that represent samples of a continuous variable in a domain such as time, space, or frequency.
