Papoulis Circuits And Systems A

Athanasios Papoulis' classic text was the first to present digital techniques as an integral part of a unified course in system theory and design, rather than as a separate unit. The enduring success of Circuits and Systems undoubtedly is due in large part to the author's concentration on fundamental ideas explained in the context of simple illustrations.

The course is now in its 5th run. General linear systems theory is well treated in Papoulis, using electrical circuits as examples, and there are plenty of end-of-the-chapter exercises and a fair amount of solved exercises along the chapters.

Other books I like (perhaps out of print) are Papoulis' "Circuits and Systems" from HRW and Siebert's "Circuits, Signals, and Systems", MIT Press (McGraw Hill). The latter is a very good book, the former is good for ground work on continuous and discrete systems (Laplace and Z transforms).

What are some good books on Signal and Systems? - Quora

A novel class of information-processing systems called cellular neural networks is proposed. Like neural networks, they are large-scale nonlinear analog circuits that process signals in real time.

This course covers signals, systems and inference in communication, control and signal processing. Topics include input-output and state-space models of linear systems driven by deterministic and random signals; time- and transform-domain representations in discrete and continuous time; and group delay.

In this paper, iterative procedures for band-limited signal extrapolation are considered. Specifically, we will show that the well-known Gerchberg-Papoulis algorithm [1], [2]: $g_n = \text{sinc}\Omega *(g + (I - T)g_{n-1})$, can be considered a special case of an iterative procedure given by Landweber in 1951 [3].
