Genetic analysis of solid tumours revealed the presence of a high degree of genetic abnormalities, such as aneuploidy, chromosome translocations etc. This is likely due to the lack of active p53 protein, and the ability of cancer cells to avoid cell death through apoptosis.

Molecular genetics is a sub-field of biology that addresses how differences in the structures or expression of DNA molecules manifests as variation among organisms. Molecular genetics often applies an "investigative approach" to determine the structure and/or function of genes in an organism's genome using genetic screens. The field of study is based on the merging of several sub-fields in biology: classical Mendelian inheritance, cellular biology, molecular biology, biochemistry, and ...

The term molecular genetics sometimes refers to a fundamental theory alleging that genes direct all life processes through the production of polypeptides, sometimes to a more modest basic theory about the expression and regulation of genes at the molecular level, and sometimes to an investigative approach applied throughout biomedical science that is based on investigative strategies grounded in the basic theory about genes.

Genetic basis and molecular pathophysiology of classical myeloproliferative neoplasms. The genetic landscape of classical myeloproliferative neoplasm (MPN) is in large part elucidated. The MPN-restricted driver mutations, including those in *JAK2*, calreticulin (*CALR*), and myeloproliferative leukemia virus (*MPL*), abnormally activate the cytokine receptor/JAK2 pathwa

Deoxyribonucleic acid (DNA) and ribonucleic acid (RNA) are the two types of nucleic acids found in living systems. DNA acts as the genetic material in most of the organisms. RNA though it also acts as a genetic material in some viruses, mostly functions as a messenger . RNA has additional roles as well.

The genetic basis for having 2 different M pigment genes is believed to arise from rearrangements within the normal tandem array of pigment genes. Most red-green color vision defects are believed to arise from gene rearrangements and, as we have explained, for most protan observers this "rearrangement" includes the deletion of all genes that ...
